

Assignment – 5

Summary:

Today's class was a cool continuation of our CSS journey. We went a bit deeper into it, exploring more tricks to make our websites look awesome. The instructor then switched gears to talk about Web Layout, which is basically how we arrange things on our webpage to make them look just right. We got to do some hands-on coding to practice what we were learning.

The instructor explained these interesting concepts like "position," "z-index," and "float." It might sound a bit technical, but don't worry, it's not rocket science. With some hands-on examples, we got to see how these things affect where our pictures, text, and buttons end up on the webpage.

The best part was that we didn't just listen – we actually coded along. It made the whole thing much more fun and easier to understand. So, by the end of the class, we not only continued our CSS adventure but also got our hands dirty with coding to create some cool layouts.
